

Lindner Center of HOPE offers consultative, comprehensive Psychological and Neuropsychological evaluations to assist in your diagnostic or treatment needs.

The purpose of the neuropsychological examination is to assess the clinical relationship between the brain/central nervous system and behavioral dysfunction, as well as to aid in clarifying one's diagnosis. We take this information, along with other multidisciplinary information to make precise recommendations for the optimization of care. Our state of the art facility can cater to any neuropsychological issues that your clients may have.

The Psychological Assessment Center at Lindner Center of HOPE consists of a multidisciplinary team of professionals who treat clients ranging in age from young children to older adults. We specialize in neuropsychological, psychoeducational, and psychodiagnostic evaluations. In addition, as part of the overall neurodiagnostic assessment, collaboration with neurological and other diagnostic techniques such as brain imaging through MRI, genetic testing, medical, and nutritional consultations are available on site.

All Psychological Assessment Center Services Involve:

- In-person interview with a clinical psychologist to gather detailed information regarding the primary reason for testing and a comprehensive medical and psychosocial history is collected.
- Personalized testing protocols including cognitive, affective, and personality measures to address the specific needs of the client.
- Feedback session with the evaluating psychologist to summarize the findings, provide detailed recommendations, and allow an opportunity to ask questions about the conclusions.
- Written report detailing test results, clinical findings, and relevant treatment recommendations.

The Psychological Assessment Center at Lindner Center of HOPE

Description of Psychological Assessment Evaluation Services

Differential Diagnostic Testing

The first step in treating any illness is thoroughly assessing the array of factors influencing one's symptoms and overall prognosis. Lindner Center of HOPE offers Diagnostic Assessments to aid in the determination and differential diagnosis of psychiatric and cognitive conditions. By better understanding the components of an illness, clinicians can utilize targeted therapies and state-of-the-science treatment technology to help clients lead a life worth living.

Learning Disability and Attention-Deficit/Hyperactivity Disorder

Education assessments are critical for identifying learning disabilities and ADHD in students with emerging cognitive and academic struggles. At Lindner Center of HOPE, leading neuropsychologists and psychologists specialize in evaluating cognitive disorders among pediatric, college-age and adult populations.

Our experts provide neuropsychological evaluations as well as develop customized recommendations for educational, vocational, and intervention planning.

Neurocognitive Disorders & Aging

With changes in cognitive abilities becoming a prominent concern with age, the early and accurate diagnosis of neurocognitive disorders is increasingly important. Comprehensive neuropsychological assessments aid in the detection of cognitive impairment and memory decline associated with normal aging as well as Alzheimer's disease, other dementias and stroke. Evaluations also screen for one's strengths in order to inform treatment strategies and enhance efforts to maintain the quality of life that everyone deserves.

Traumatic Brain Injury & Rehabilitation

The chronic cognitive and behavioral changes that follow traumatic brain injury pose numerous difficulties to patients and their families. As part of our mission, Lindner Center of HOPE aims to facilitate the rehabilitation of our clients by providing scientifically-advanced assessment services and care. Our neuropsychological evaluations assess for cognitive, behavioral and emotional changes as well as functional improvements over the course of recovery. Results from testing are used for developing strategies to remediate symptoms and promote adaptive daily living skills.

Sports-Related Head Injury

Concussions and other sports-related brain injuries place players at high risk for further injury and lasting cognitive impairment. The Psychological Assessment Center conducts evaluations to administer the recommended baseline cognitive functioning tests, examine a player's post-injury symptoms and assist clinicians and athletic trainers in making difficult return-to-play decisions.

To make a referral, simply call 513-536-HOPE (4673).
