### Outpatient Autism Testing and Therapy for Young Children

Autism spectrum disorder is a condition related to brain development that impacts how a person perceives and socializes with others, causing problems in social interaction and communication.

Autism spectrum disorder begins in early childhood and eventually causes problems functioning in society — socially, in school and at work, for example. Often children show symptoms of autism within the first year. A small number of children appear to develop normally in the first year, and then go through a period of regression between 18 and 24 months of age when they develop autism symptoms.

While there is no cure for autism spectrum disorder, early and accurate diagnosis and early treatment can make a big difference in the lives of many children.

Lindner Center of HOPE Professional Associates now has expanded outpatient autism testing and therapy services.

Elisha Eveleigh Clipson, PhD, Child psychologist, is providing therapy and psychological testing for children, adolescents and families in the outpatient setting. She specializes in testing related to developmental disabilities including Autism Spectrum Disorder.

Dr. Eveleigh specifically offers:

- Autism evaluations for children ages two and older.
- Autism testing for older children and teens.
- Developmental testing to determine whether symptoms might be consistent with ASD or another developmental concern such as ADHD or a mental health concern such as anxiety.
- Therapy for children ages 5 and older along with their families.
- Therapy for children struggling with anxiety, family transitions/divorce, social concerns/bullying, and behavioral concerns.
- Therapy for children who have Obsessive-Compulsive Disorder and childhood depression.
